

ABSTRACT

An image combining portable terminal combines a recorded image prepared in an uncombined image recording portion and a captured image captured by a camera portion. A plurality of sets of mask information defining at least one area in which the captured image is to be combined with the recorded image are stored in a mask recording portion. The mask information acquiring portion selects desired mask information from the mask recording portion in response to an instruction of a user. The image combining portion combines the recorded image and the captured image in an area designated by the mask information selected by the mask information acquiring portion.
